Sequences AASO3873-AASO3922 represent isolated nucleic acid molecules and PCR primers of the invention. acid of the invention. Secreted proteins and their related nucleic acids can be used in the diagnosis of or susceptibility to a pathological condition by determining the presence or susceptibility to a pathological condition by determining the presence or sheer a beence of a mutation in a nucleic acid or the presence or amount of expression of a secreted protein. The sequences are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The antibodies to the disorders and in diagnostic immunossays e.g. radioimmunoassays or enzyme disorders and in diagnostic immunossays e.g. radioimmunoassays or enzyme disorders and in diagnostic immunossays e.g. radioimmunoassays or enzyme diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders e.g. cardioxas necessably charteria, viruses and fungi and ocular disorders e.g. corneal infection. The peptides can also be used to aid wound healing and epithelial cell proliferation, to help prevent skin ageing due to sunburn, to maintain corgans before transplantation, to releproservative to alter storage capabilities.
                                                                                                                                                                                                                                                                                                                                      useful

                                                                                                                                                                                                                                                                                                                                                                                           antion acid sequences given in AAMB1921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) activity, and can be used in gene therapy and vaccine production. (I) cytostatic cartivity, and can be used in gene therapy and vaccine production. (I) cytostatic sample, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally. (I) cytoplement the patients own production of (I). Additionally. (I) cytoplement the patients own production of (I). Additionally. (I) cytoplement the patients own production of (I). By inserting the cell to express the protein. (I) proteins and polynuclectides may be used to prevent.

Concers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent inwante/haematopoietic antigen genomic sequences from the present invention. AAK849421 to AAK84950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis .
                                                                                                                                                                                                                                                                                                                                                                                 AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 aggattataagaacggaggcctatggaggcccatgagggggctgaacgtcacagcaaca 120

amino acid sequences given in AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) cactivity, and can be used in gene therapy and vaccine production. (I) proteins and polynocleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting polynucleotides may be used to produce the secreted (I), by inserting the rotein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic artigen genomic sequences from the present invention. AAK84962 and AAM83269 represent invention. AAK84962 and AAM83269 represent invention.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) and sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polyvuocleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/mamatopoietic antigen genomic sequences from the present invention. AAK84942 to AAK84950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation; ss.

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to erytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or eptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                   protein, hMSC-o (AAB60658), and cDNA encoding it (AAF5920). hMSC-o is expressed in normal human hypothalamus tissue. The invention also relates to the preparation of hMSC-o proteins and nucleic acids, and the detection of hMSC-o proteins and nucleic acids in a sample. The present sequence represents cDNA encoding hMSC-o.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective;

The polynucleotide and the polypeptide encoded by it are useful in the treatment of various immune deficiencies and disorders. The deficiencies and disorders may be genetic, may be caused by a viral (e.g. HIV), bacterial or fungal infection, or may result from an autoimmune disorder, a coagulation disorder (e.g. haemophila), inhibition of tumour cell proliferation, suppression of an inflammatory response or treatment of a nervous system disorder such as Alzheimer's disease. Detection of the presence or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosis and/or prognosis of one

Comprising the sequences given in AA212532 to AA21779. Also described is comprising the sequences given in AA212532 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA212532 to AA21779. The coll the 5248 polynucleotide sequence of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, be used for a variety of purpose, e.g. detection of expression levels, can be used for raising antibodies for experimental, diagnostic and therefore the polynucleotides can be used for raising antibodies for experimental, diagnostic and carrays for diagnostics (which may be used to determine function of an cencoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for contrible and an experimental cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for

Sequence 9, Application US/09268163B
Patent No. 6353091
GENERAL INFORMATION:
APPLICANT: Lipscombe, Diane
APPLICANT: Lipscombe, Diane
APPLICANT: Lipscombe, Diane
APPLICANT: Lipscombe, Diane
TITLE OF INVENTION: HUMAN N-TYPE CALCIUM CHANNEL ISOFORM AND USES THEREOF
FILE REPERENCE: B1055/7000
CURRENT FILING DATE: 1999-03-12
EARLIER APPLICATION NUMBER: US/09/268,163B
CURRENT FILING DATE: 1998-03-13
NUMBER OF SEQ ID NOS: 28
SOFTWARE: FastSEQ for Windows Version 3.0
SOFTWARE: FastSEQ for Windows Version 3.0
LENGTH: 7011
TYPE: DNA
ORGANISM: Rattus norvegicus
FEATURE:
NAME/KEY: CDS
LOCATION: 1.7008
US-09-268-163-9
US-09-268-163-9

/note="Vector: pSPORT1; Site_1: Not I; Site_2: Sal I; Five libraries representing EIO:5/12.5 pancreatic bud, EI6.5 pancreas, newborn pancreas, adult pancreas, and adult islets of Langerhans were seperately constructed using SuperScript Plasmid Library kit (Life Technologies). cDNA was made by oligo-dT priming and size-selected by column fractionation. Libraries were amplified once on solid support and plasmid DNA from each library was prepared and mixed in equal amounts: The mixed library DNA was normalized by method #4 from Bonaldo, Lennon, and Scares 1956 Genome Research 6:791-806; O.5 microgram single-stranded mixed library plasmid DNA was mixed with 5 micrograms PCR product representing mixed library inserts and hybridized to an Ecot of 6. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this library."

polylinker; Site_l: Not I; Site_l: ECO RI; The UNL-P-FN
library is a normalized library representing porcine
ovarian follicles, ranging between 2.0 to 10.0 mm in
diameter, collected during 7 days of the follicular phase
of the pig estrous cycle. This library was derived from
the library UNL-P-F2. The tag is a string of 5-6
nucleotides present between the Not I site and ther
nucleotides present between the Not I site and ther
-linc-dT track. The library was constructed as described
